

Search path for models

LemonTree Server 2.0.1 provides the possibility to configure a path and select that path in the Session Dialog.

LemonTree Server searches the path for .eap(x) and provides a list and the possibility to select a file from that folder (or subfolders).

The purpose of this is to save shortcut-eaps or standard .eap files for better DB Connection String handling.

How to configure that path

There is a parameter "modelSearchPath" in the web.config where this path can be configured.
